

ABSTRACT

A system may direct first energy to only a first interconnect element, the first interconnect element contacting a first conductive contact of a first device and a second conductive contact of a second device. A first electrical connection may be formed between
5 the first conductive contact and the second conductive contact based at least in part on the first energy. Further, second energy may be directed to only a second interconnect element, the second interconnect element contacting a third conductive contact of the first device and a fourth conductive contact of the second device. A second electrical connection may be
10 formed between the third conductive contact and the fourth conductive contact based at least in part on the second energy.
